COMP218
OBJECT-ORIENTED PROGRAMMING

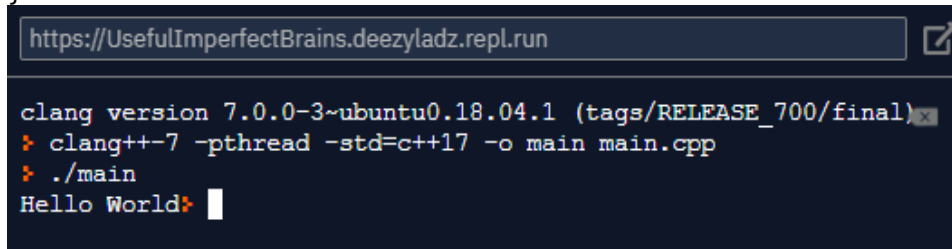

LAB WORK NO. 1

Prepared by **David O. Ladipo** (174574)
Submitted to Dr. Ferhun Yorgancıoğlu

Task - 1(a)

```
#include <iostream>

int main()
{
    std::cout << "Hello World"; // prints Hello world
    return 0;
}
```

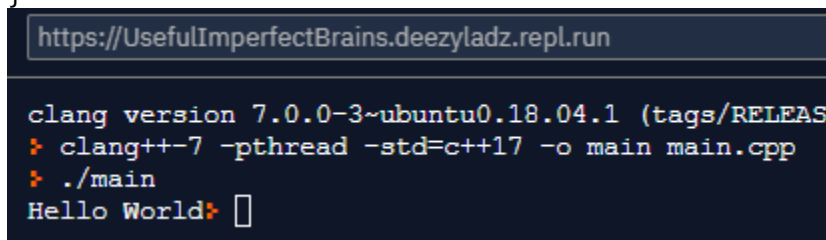

```
https://UsefulImperfectBrains.deezyldz.repl.run

clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_700/final)
❯ clang++-7 -pthread -std=c++17 -o main main.cpp
❯ ./main
Hello World❯
```

Task - 1(b)

```
#include <iostream>
using std::cout;
int main()
{
    cout << "Hello World"; // prints Hello world
    return 0;
}
```

```
https://UsefulImperfectBrains.deezyldz.repl.run

clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_700/final)
❯ clang++-7 -pthread -std=c++17 -o main main.cpp
❯ ./main
Hello World❯
```

Task - 1(c)

```
#include <iostream>
using namespace std;
int main()
{
    cout << "Hello World"; // prints Hello world
    return 0;
}
```

<https://UsefulImperfectBrains.deezyladz.repl.run>

```
clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_7.0.0-1)
> clang++-7 -pthread -std=c++17 -o main main.cpp
> ./main
Hello World> █
```

Task – 2

```
#include <iostream>
using namespace std;

int main()
{
    int firstNum, secondNum, sumOfTwoNum;

    cout << "Enter First Number: " << endl;
    cin >> firstNum; //value of first number input from user stored in firstNum

    cout << "Enter Second Number: " << endl;
    cin >> secondNum; //value of second number input from user stored in secondNum

    // sum of two numbers is stored in variable sumOfTwoNumbers
    sumOfTwoNum = firstNum + secondNum;

    // Prints sumOfTwoNum
    cout << firstNum << " + " << secondNum << " = " << sumOfTwoNum;
}
```

<https://UsefulImperfectBrains.deezyladz.repl.run>

```
clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_7.0.0-1)
> clang++-7 -pthread -std=c++17 -o main main.cpp
> ./main
Enter First Number:
11
Enter Second Number:
31
11 + 31 = 42> █
```

Task – 3

```
#include <iostream>
#include <iomanip>
using namespace std;
```

```

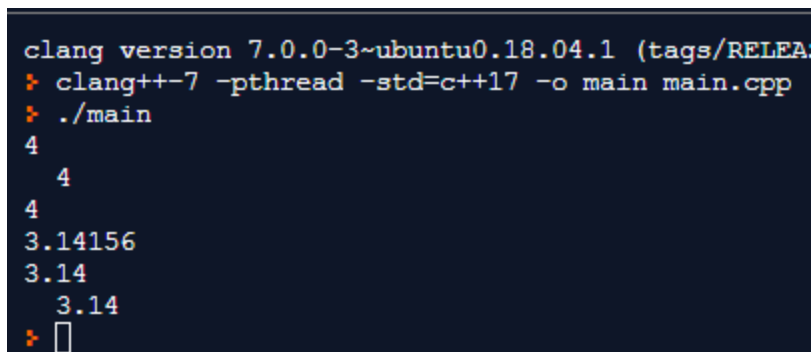

int main()
{
    float x = 3.141559f;

    cout << 4 << endl; //prints 4 to the screen
    cout << "  " << 4 << endl; //prints 2 spaces and 4 to the screen
    cout << 4 << "  " << endl; //prints 4 and 2 spaces to the screen
    cout << x << endl; //prints float x = 3.141559f;

    cout <<fixed<<setprecision(2)<<x<< endl; //rounds up x to 2decimal places
    cout <<"  "<< fixed << setprecision(2)<< x << endl; //prints to spaces and
rounds up x to 2decimal places

    return 0;
}

```

```

clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_7.0.0-3~ubuntu0.18.04.1)
> clang++-7 -pthread -std=c++17 -o main main.cpp
> ./main

> 

```

Task – 4

```

#include <iostream>
#include <iomanip>
using namespace std;
int main()
{
    int a = 2;
    char b = 'f';
    float c = 3.1415f;
    double d = 3;
    /*Set field width (setw):
    Sets the field width to be used on output operations.

```

Behaves as if member width were called with n as argument on the stream on which it is inserted/extracted as a manipulator (it can be inserted/extracted on input streams or output streams).*/

```

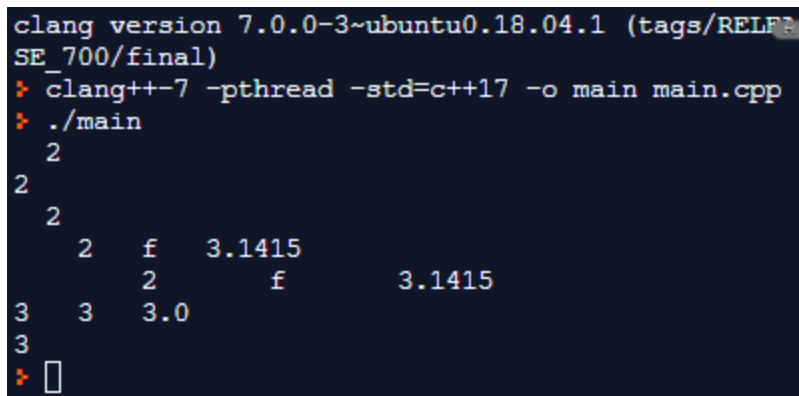

cout << setw(3) << a << endl; //prints 3 spaces before a
cout << setw(3) << left << a << endl; // prints a then 3 spaces
cout << setw(3) << right << a << endl; // prints 3 spaces before a
cout << '\t' << a << '\t' << b << '\t' << c << endl;
cout << setw(9) << a << setw(8) << b << setw(13) << c << endl;
cout << d << '\t' << setprecision(1) << d << '\t' << fixed << setprecision(1) <<
d << endl;
cout.unsetf( ios::fixed );
cout << d << endl;
}

```

/*Set decimal precision (setprecision)

Sets the decimal precision to be used to format floating-point values on output operations.

Behaves as if member precision were called with n as argument on the stream on which it is inserted/extracted as a manipulator (it can be inserted/extracted on input streams or output streams).*/

```

clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_700/final)
> clang++-7 -pthread -std=c++17 -o main main.cpp
> ./main

3 3 3.0 f 3.1415
3
> 

```

Task – 5

```

#include <iostream>
#include <iomanip>
using namespace std;
/*Static Cast: This is the simplest type of cast which can be used. It is a
compile time cast.It does things like implicit conversions between types (such as
int to float, or pointer to void*), and it can also call explicit conversion
functions (or implicit ones).*/
int main()
{
int a = 3;
char b = 'f';

```

```
cout << a << '\t' << static_cast<char>(a) << endl;  
cout << b << '\t' << static_cast<int>(b) << endl;  
cout << ( 2/3 ) << '\t' << ( static_cast<float>(2) / 3 ) << endl;  
}
```

```
clang version 7.0.0-3~ubuntu0.18.04.1 (tags/RELEASE_700/final)  
❯ clang++-7 -pthread -std=c++17 -o main main.cpp  
❯ ./main  
3  
f    102  
0    0.666667  
❯
